Full Stack Assignment – 04

Assignment ID: FSD-04
Title: Review Moderation Platform
Duration: 3 Hours

1️⃣ Objective

Design and develop a **Review Moderation Platform** where users can submit reviews and moderators can control what gets published.
The system must prevent duplicate submissions and ensure **data persistence using a database**.

2️⃣ User Roles

USER

- Register and log in to the system
- Submit a review
- View own submitted reviews and their status

MODERATOR

- Log in to the system
- View all submitted reviews
- Approve or reject reviews

3️⃣ Functional Requirements

Authentication & Authorization

- Implement user registration and login
- Use **JWT-based authentication**
- Protect all backend APIs using JWT
- Enforce **role-based access control** on APIs and frontend views

Review Management

- USER can submit reviews with basic details
- Reviews must be stored in the database
- MODERATOR can approve or reject reviews
- Review status must be fetched dynamically from the database

4 Business Rule (Critical)

⚠️ **A user must not be allowed to submit duplicate reviews for the same item.**

Duplicate detection must be enforced at the backend using database checks.

5 Technical Constraints (Mandatory)

- All review data **must persist in a database**
- Hardcoded or in-memory review storage is **not allowed**
- Backend APIs must reflect actual database state
- JWT authentication and role validation are mandatory
- Use environment variables for sensitive configuration

6 Frontend Requirements

- Login and registration pages
- Role-based dashboards for USER and MODERATOR
- Review submission form for USER
- Review listing with approval status
- Approve/Reject actions for MODERATOR

UI design is not evaluated; logic and flow matter most.

7 Submission Requirements (Strict)

GitHub Repository

- Backend source code
- Frontend source code
- Proper folder structure
- Clear and meaningful commit history

Live Deployment

- Live frontend deployment link
- Live backend deployment link
- Backend must be connected to the database

README.md (Mandatory)

The README file must include:

- Project overview
- Tech stack used
- User roles and permissions
- API endpoints

- Database schema or collections
- Steps to run the project locally
- Live frontend and backend links

8️⃣ Evaluation Note

Evaluation focuses on **backend validation, role enforcement, and end-to-end integration**.
