Full Stack Assignment – 14

Assignment ID: FSD-14

Title: Feature Request Management System

Duration: 3 Hours

1️⃣ Objective

Design and develop a **Feature Request Management System** that allows users to submit feature requests and administrators to manage them.

The system must prevent duplicate requests and ensure **data persistence using a database**.

2️⃣ User Roles

USER

- Register and log in to the system
- Submit feature requests
- View own submitted requests

ADMIN

- Log in to the system
- View all feature requests
- Manage request visibility or status

3️⃣ Functional Requirements

Authentication & Authorization

- Implement user registration and login
- Use **JWT-based authentication**
- Protect all backend APIs using JWT
- Enforce **role-based access control** on APIs and frontend views

Feature Request Handling

- USER can submit feature requests with title and description
- All feature requests must be stored in the database
- ADMIN can view and manage submitted requests

4️⃣ Business Rule (Critical)

⚠️ **Feature requests with duplicate titles must not be allowed.**

Duplicate detection must be enforced at the backend.

5 Technical Constraints (Mandatory)

- All feature request data **must persist in a database**
- Hardcoded or in-memory storage is **not allowed**
- Backend APIs must reflect actual database state
- JWT authentication and role validation are mandatory
- Sensitive configuration must use environment variables

6 Frontend Requirements

- Login and registration pages
- Role-based dashboards for USER and ADMIN
- Feature request submission form
- Feature request listing view

UI appearance is not evaluated; functional correctness matters.

7 Submission Requirements (Strict)

GitHub Repository

- Backend source code
- Frontend source code
- Proper folder structure
- Clear and meaningful commit history

Live Deployment

- Live frontend deployment link
- Live backend deployment link
- Backend must be connected to the database

README.md (Mandatory)

The README file must include:

- Project overview
- Tech stack used
- User roles and permissions
- API endpoints
- Database schema or collections
- Steps to run the project locally
- Live frontend and backend links

8 Evaluation Note

Evaluation focuses on **backend validation, role enforcement, and end-to-end execution**.
