**Full Stack Assignment – 28**

**Assignment ID:** FSD-28

**Title:** Content Publishing Workflow System

**Duration:** 3 Hours

## 1️⃣ Objective

Design and develop a **Content Publishing Workflow System** that allows authors to create content and editors to manage publication.

The system must enforce post-publication immutability and ensure **data persistence using a database**.

## 2️⃣ User Roles

**AUTHOR**

- Register and log in to the system
- Create content drafts
- View own content and its status

**EDITOR**

- Register and log in to the system
- Review content submissions
- Publish or reject content

## 3️⃣ Functional Requirements

**Authentication & Authorization**

- Implement user registration and login
- Use **JWT-based authentication**
- Protect all backend APIs using JWT
- Enforce **role-based access control** on APIs and frontend views

**Content Management**

- AUTHOR can create content with title and body
- Content data must be stored in the database
- EDITOR can publish or reject submitted content
- Content status must be retrieved dynamically

## 4 Business Rule (Critical)

### ⚠️ Published content must not be editable.

Any edit attempt on content marked as published must be rejected.

## 5 Technical Constraints (Mandatory)

- All content and workflow data **must persist in a database**
- Hardcoded or in-memory storage is **not allowed**
- Backend APIs must reflect actual database state
- JWT authentication and role validation are mandatory
- Use environment variables for sensitive configuration

## 6 Frontend Requirements

- Login and registration pages
- Role-based dashboards for AUTHOR and EDITOR
- Content creation and submission view for AUTHOR
- Content review and publish/reject view for EDITOR

UI design is not evaluated; workflow correctness is the focus.

## 7 Submission Requirements (Strict)

**GitHub Repository**

- Backend source code
- Frontend source code
- Proper folder structure
- Clear and meaningful commit history

**Live Deployment**

- Live frontend deployment link
- Live backend deployment link
- Backend must be connected to the database

**README.md (Mandatory)**

The README file must include:

- Project overview
- Tech stack used
- User roles and permissions
- API endpoints
- Database schema or collections

- Steps to run the project locally
- Live frontend and backend links

### 8️⃣ Evaluation Note

Evaluation focuses on **state immutability enforcement, role control, and end-to-end execution**.
