

LTIMindtree Recruitment 2026

Exam pattern, selection flow and key preparation areas — consolidated from candidate reports and 2026-batch drive pages (Oct 2026).

At a glance

Item	Details
Role (base)	Graduate Engineer Trainee (GET) — ₹4.05 LPA (INR 4,05,233 p.a. reported for 2026 drives)
Upgrade tiers	~₹5–6.5 LPA for students shortlisted from the OA who clear the coding / interview upgrade round
Eligibility (typical)	60% or 6.0 CGPA in 10th, 12th and graduation; no active backlogs; circuitual branches (CSE, IT, ECE, EEE and allied)
Test platform	AMCAT (SHL) style, online proctored
OA length	91 MCQs + SVAR spoken English · 130 minutes · sectional timing (unused time does not carry over)
Negative marking	Not reported in recent AMCAT-based drives — still, avoid blind guessing

Selection flow

* The upgrade round is not part of every drive. Where it runs, only high OA scorers receive the mail. A separate AI/bot interview (resume + one very simple coding question) has also been reported as non-eliminatory and used only for a salary hike.

Round 1 — Online Assessment (GET pattern)

#	Module	Qs	Time	What it tests
1	English Comprehension	12	15 min	Reading comprehension (3–4 passages), vocabulary, grammar
2	Logical Ability	12	15 min	Coding-decoding, blood relations, direction, series, seating, data sufficiency
3	Quantitative Ability	12	15 min	Arithmetic: number system, LCM/HCF, time & work, pipes, averages, P&L, %
4	Basic Analytical Ability	10	10 min	Puzzles and analytical reasoning under tight time
5	Computer Programming	25	35 min	Output tracing, pseudocode, loops, recursion, pointers, bitwise ops
6	Computer Science	20	20 min	OOPs, DBMS & SQL, OS, CN, software engineering, basic DS
7	Spoken English (SVAR)	7 sec.	20 min	AI voice-evaluated pronunciation, fluency, listening, grammar
	Total	91 + SVAR	130 min	

Watch this module: Computer Programming

Some 2027-batch sources report a revised version: Computer Programming 12 Qs in 15 min (and Analytical 25 Qs in 10 min). Topics are unchanged — train at 25 Qs in 35 min and students will handle either version.

Modules 5 + 6 together are 45 of 91 questions — the technical block decides most OA scores.

Spoken English (SVAR) — section breakdown

Section	Activity
A	Read 10 questions aloud · Listen to and repeat 8 sentences
B	Listen to an audio clip and repeat it (speaking + listening)
C	Listen to a sentence · fill the blank with the correct word · repeat the complete sentence
D	Listen to a sentence containing an error · correct it and repeat aloud
E	Listen to a story and answer questions about it
F	Complete an ongoing conversation between two people
G	Speak on a given topic for 30 seconds

Why SVAR matters

It is AI-scored and can eliminate silently — strong coders are regularly filtered out here.

Test-day rules: headset with mic, quiet room, speak at a steady pace, answer in complete sentences, never leave a response blank.

Round 2 — Package upgrade round (for top OA scorers)

Multiple independent reports confirm that after the OA, high scorers receive a mail inviting them to an extra coding assessment and/or interview for a higher package. It is not run in every drive, and tier amounts vary by batch.

Aspect	What has been reported
Who gets it	Students who score well in the OA — the mail is the invitation; others continue on the GET track
Format	Coding assessment of 2-4 easy-to-medium problems (Java / Python / C / C++); SQL sometimes emphasised. Some drives use an AI/bot interview instead
Scoring	One report: 2-3 problems fully passing → Level 1 package; all problems passing → Level 2 (highest)
Package	₹4.05 LPA base → ~₹5 LPA → up to ~₹6.5 LPA depending on tier and batch
Risk	Not eliminatory for the base offer in most reports — students keep their GET track if they do not clear it

Coding topics to drill: arrays, strings (reverse words, remove vowels, duplicates), number problems (prime, power of 2, digit sums), sorting/searching, simple recursion, stack/queue/linked-list basics, and one easy DP pattern. Solutions must pass **all** test cases — partial logic does not earn the upgrade.

Rounds 3 & 4 — Interviews

Round	Duration	Commonly asked
Technical	30-40 min	Self-intro; project end-to-end (use case, your role, tech choices, problems faced); OOPs four pillars, abstract class vs interface; SQL queries, keys, normalization; OS basics (deadlock); output-based questions in your language; write a small program (prime, power of 2 with exception handling); list vs tuple vs set (Python); a situational question
HR	15-20 min	Why LTIMindtree; why should we hire you; strengths and improvement areas; interest in the role; relocation and shift flexibility; service agreement discussion

Important areas — module-wise checklist

Module	Priority topics	Weight
English Comprehension	Long RC passages (inference, tone, main idea), synonyms/antonyms, sentence correction, fill in the blanks	Medium
Logical Ability	Coding-decoding, blood relations, direction sense, number/letter series, seating arrangement, data sufficiency, syllogisms	Medium
Quantitative Ability	Number system, LCM & HCF, divisibility, time & work, pipes & cisterns, averages, percentages, profit & loss, SI/CI, TSD, basic probability	Medium
Basic Analytical	Puzzles, truth-teller/liar, arrangements — practise speed: 1 min per question	Medium
Computer Programming	Output prediction (C/C++/Java), pseudocode tracing, loops & nested loops, recursion, pointers & arrays, bitwise operators (&, , ^, <<, >>), data types & operator precedence, basic stack/queue/tree traversal	High
Computer Science	OOPs (inheritance, polymorphism, abstraction, encapsulation), DBMS (keys, normal forms, joins, SQL queries), OS (process, scheduling, deadlock, memory), CN (OSI, TCP/UDP, IP basics), SDLC & testing basics	High
SVAR	Pronunciation, sentence repetition, error correction aloud, listening comprehension, 30-second topic speaking	High (eliminary)
Coding (upgrade)	Arrays, strings, math problems, sorting/searching, recursion, basic DS, one easy DP — full test-case pass	Upgrade only

Trainer notes

Aim students to **top** the OA, not just clear it — the OA score decides who gets the upgrade mail. Run a separate coding track (2–4 problems, all test cases) for students targeting ₹5–6.5 LPA. Patterns change drive to drive; confirm the module list in the campus mailer before the final mock. Discard the widely copied '180-minute, 4 coding problems, Advanced Algorithms' pattern — no candidate report supports it.

Figures are compiled from public prep sites and candidate reports, not an official LTIMindtree document. Verify against your campus mailer.
